

TriMix for Travel[®] is a unique alternative form of trimix for injection which does not have to be refrigerated. It consists of a powdered form of trimix and bacteriostatic water in separate vials. At time of use, the bacteriostatic water reconstitutes the powdered trimix. The trimix returns to its liquid form and is injected as usual.

TriMix for Travel[®] is made from the same ingredients as regular trimix only it requires “no refrigeration”. TriMix for Travel[®] is well received by patients who formerly carried their trimix in ice packs. Active mobile patients can now more easily travel with their medicine and leave their ice packs home.

TriMix for Travel[®] consists of:

1. Trimix for Travel, (Trimix only in powder form).
2. Sterile water which is added to the powder at time of use. The powdered trimix returns to its liquid form.
3. Standard syringes included for self-injection as usual.

NO MORE ICE PACKS.

Many ED patients appreciate the freedom of no ice packs.
